

Powerline Adapter

200Mbps Powerline Ethernet Adapter

USER MANUAL

HNPL200MS/HNPL200K2

www.hamletcom.com

Dear Customer,

thanks for choosing an Hamlet product. Please carefully follow the instructions for its use and maintenance and, once this item has run its life span, we kindly ask You to dispose of it in an environmentally friendly way, by putting it in the separate bins for electrical/electronic waste or to bring it back to your retailer who will collect it for free.

We inform You this product is manufactured with materials and components in compliance with ROHS directives: 2002/95/CE; with RAEE Directives: 2003/96/CE, Italian Legislative Decree 2005/151 and below EEC Directives:

EN 55022: 2006 (Class B)

EN 61000-3-2: 2000 + A2: 2005

EN 61000-3-3: 1995 + A1: 2001 + A2: 2005

EN 55024: 1998 + A1: 2001 + A2: 2003

IEC 61000-4-2: 1995 + A1: 1998 + A2: 2000;

IEC 61000-4-3: 2002 + A1: 2002;

IEC 61000-4-4: 2004; IEC 61000-4-5: 1995 + A1: 2000;

IEC 61000-4-6: 1996 + A1: 2000; IEC 61000-4-8: 1993 + A1: 2000;

IEC 61000-4-11: 2004

1 – Introduction

1.1 Overview

The Hamlet Powerline Adapter operates on HomePlug AV standard, providing up to 200Mbps data speed over the existing household power supply. This Product is cost-effective, easy to create a home network without spending time and money to run expensive CAT-5 cabling. Hamlet Powerline Adapter is the best solution for no-new-wire networking in the house or office.

1.2 Specification

- Standard: HomePlug Powerline Specification AV compliant
- Speed: up to 200Mbps
- Modulation: supports OFDM, 1024/256/64/16/8 QAM, QPSK, BPSK, and ROBO modulation schemes.
- Frequency: 4.3 MHz ~ 20.9 MHz
- Security: 128-bits AES encryption
- IEEE802.3 10Base-T, IEEE802.3U 100Base-TX

1.3 LED Indicators

The Powerline Ethernet Adaptor has three LEDs indicator:

 PWR	Turn on when connected to AC power supply.
 PLC	Turn on when detected and connected with another HomePlug adaptor within the network.
 ETH	Turn on when connected to the Ethernet card of the computer or Ethernet Hub / Switch.

1.4 Package Contents

Make sure that you have the following items:

- Powerline Ethernet Adaptor
- RJ-45 Ethernet Network cable
- Configuration Utility CD
- Quick Installation Guide

1.5 System Requirements

- Operating Systems: Windows 98SE/Me/2000/XP or Vista
- Pentium III 300 MHz or above
- Powerline device
- AC power outlet

2 – Installation

2.1 Installing Powerline Device

1. Connect one Powerline Device to your computer with the Ethernet cable.
2. Connect the device to the Power Outlet.

2.2 Installation of Configuration Utility

Users are requested to verify that no other Encryption Management Utilities are installed prior to the installation of this utility. Other utilities should be uninstalled before installing this utility.

1. In order to install, insert the Windows OS Configuration Utility CD-ROM into the computer's CD-ROM drive. The program shall run automatically. Alternatively this can also be done manually by double clicking the **autorun.exe** file on the CD.

2. If you click the **"Powerline Utility"** button, the screen will appear as shown in Figure 2-1. Click the **"Next"** button to continue.

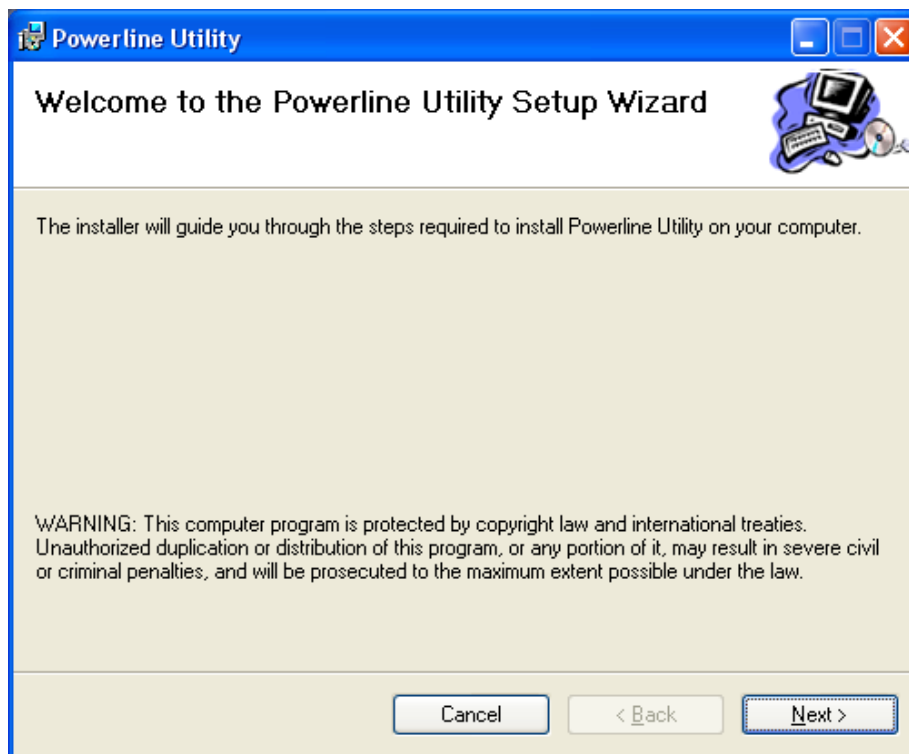

Figure 2-1

3. Please click the **"Next"** button.

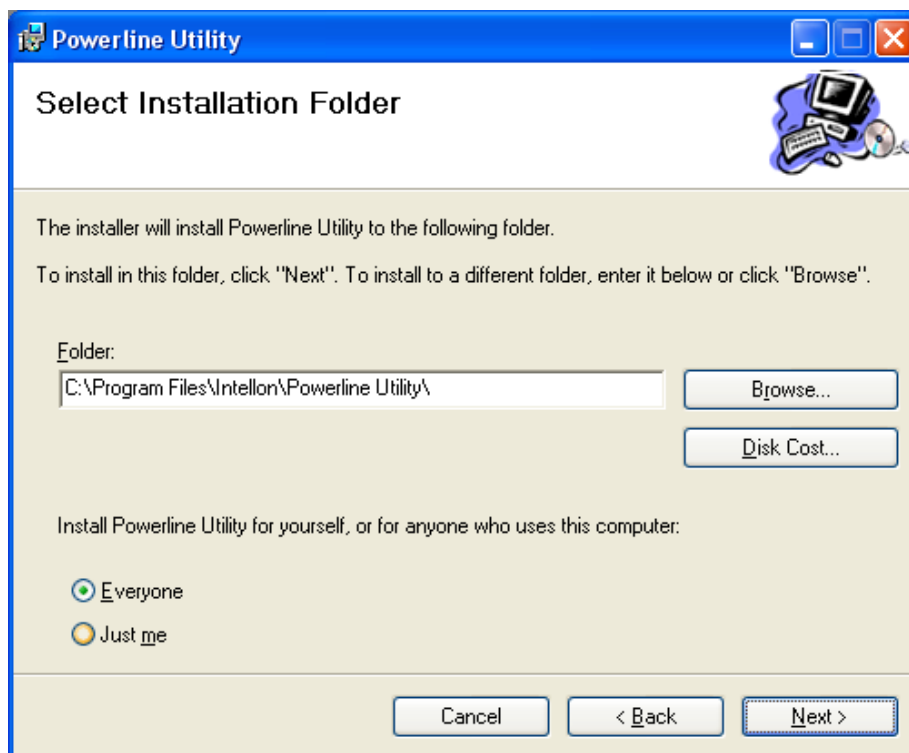

Figure 2-2

4. Please click the “**Next**” button again.

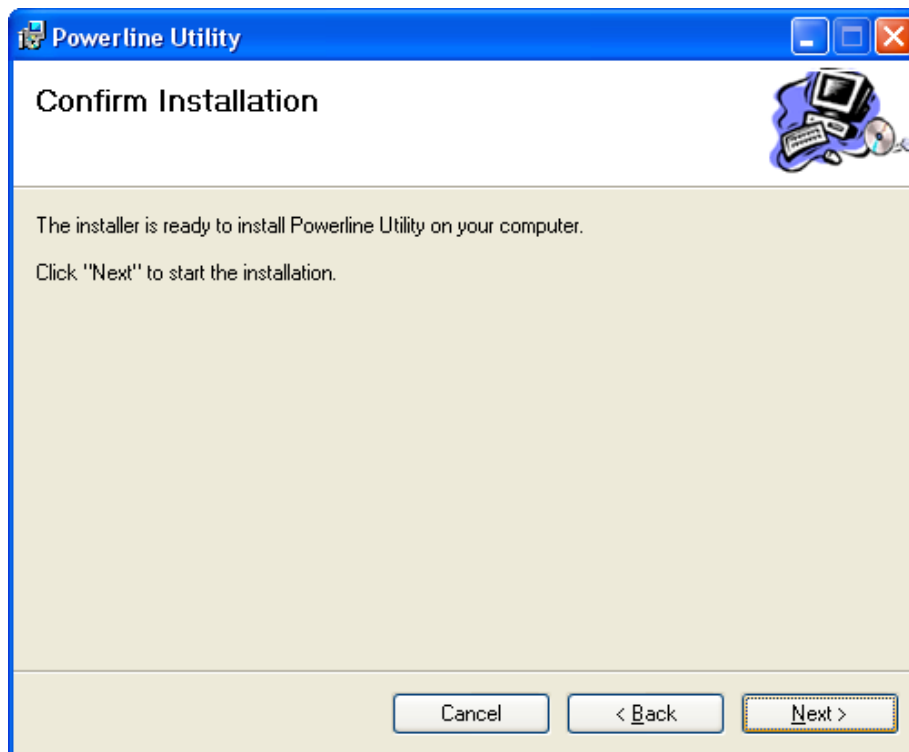

Figure 2-3

5. Please click the “**Close**” button to finish installation.

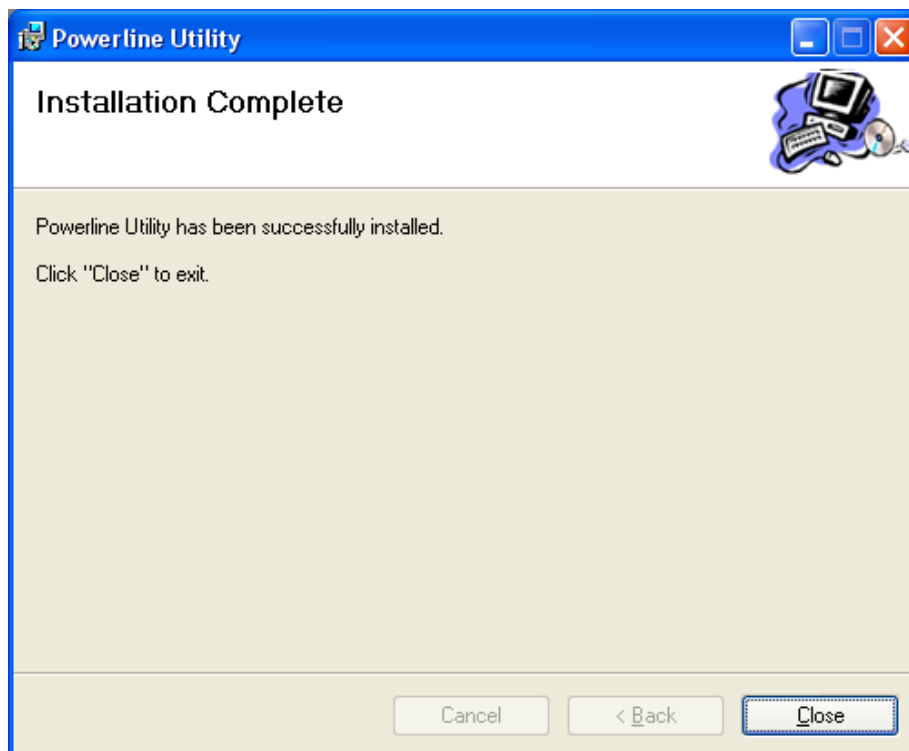

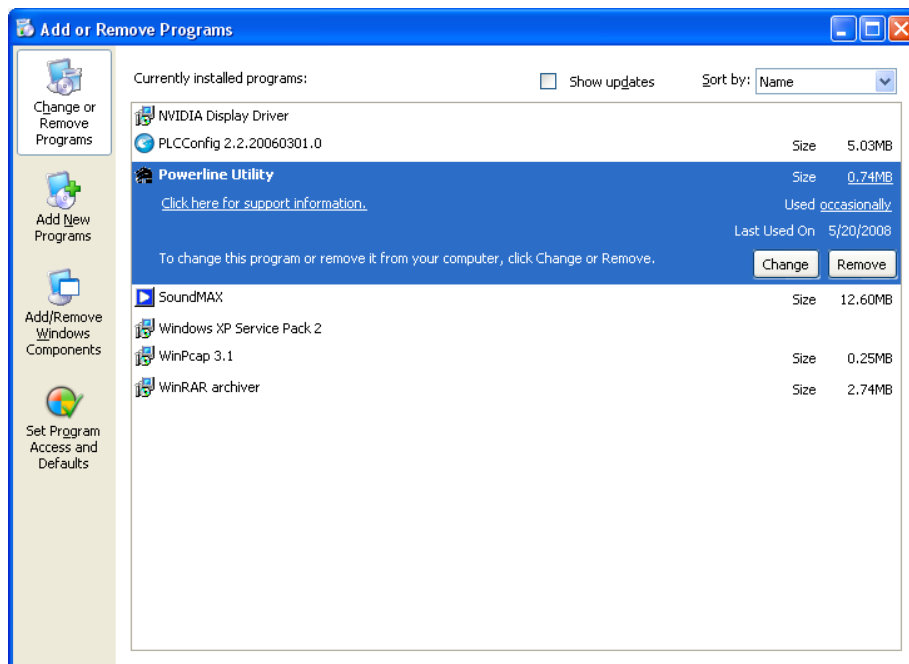

Figure 2-4

2.3 Uninstallation of Configuration Utility

1. To uninstall the **Configuration Utility**, go to the “**Control Panel**” of your system.
2. Open the “**Add/Remove Programs**”.
3. Select and double click on the “**Powerline Utility**” in the **Add/Remove Programs Properties**.

4. Follow the on screen instructions to uninstall the **Powerline Utility**.

3 – Configuration Utility Setup

Introduction

The Powerline Configuration Utility for Windows OS enables the users to identify HomePlug devices on the powerline network, measures data rate performance, ensures privacy and performs diagnostics by setting user defined secure powerline networks. The Utility will use a Graphical User Interface (GUI) with limited user selectable options.

3.1 Main Tab

In order to start the utility, double-click the utility icon on your computer Desktop. Figure 3-1 shows the main screen of the Configuration Utility. The top panel of the screen shot shows a Powerline device connected locally to the host computer. The bottom panel shows one device connected remotely to the computer running the utility.

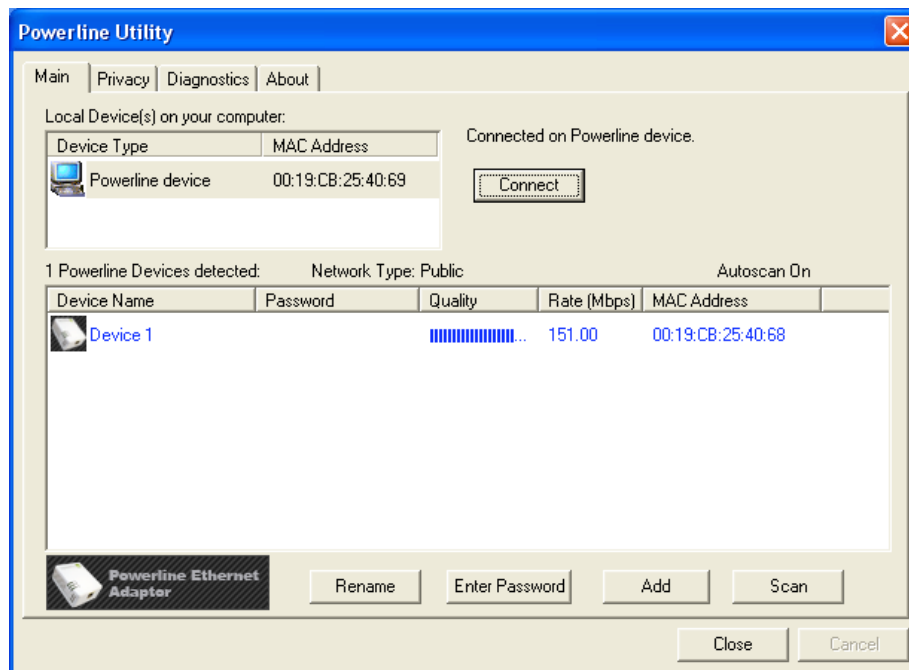

Figure 3-1: Main Screen with Powerline device Local

The **Main** screen provides a list of all powerline devices logically connected to the computer when the utility is running. The **top panel** shows all local devices connected to the computer's NIC (Network Interface Card). In most cases, only one device will be seen. In situations where there are more than one local device being connected, such as a USB or an Ethernet adapter, the user can select the local device by clicking on it and then click the **Connect** button to its right.

MAC Address column shows the Remote device's MAC address.

Password column by default is blank and “Enter Password” button can be used to enter it.

To set the **Password** of the device (required when creating a private network), first select the device by clicking on its name in the lower panel and then click on the Enter Password button. A dialog box will appear as shown in Figure 3-3 to type the password. The selected device name is shown above the password field and the password can be verified by hitting the OK button. The Password field accepts the Device password in any case formats, with or without dashed between them. A confirmation box will appear if the password was entered correctly. If a device was not found, the user will be notified along with the suggestions to resolve common problems. This process might take a few seconds to get completed.

Figure 3-3: Set Device Password

Add button is used to add a remote device to the existing network by entering the device password of the device. A dialog box will appear as shown below in Figure 3-4. The dialog box allows the user to enter both a device name and the password. A confirmation box will appear if the password was entered correctly and if the device was found in the powerline network. If a device was not found, the user will be notified and suggestions to resolve common problems will be presented.

Figure 3-4: Add Remote Device

Note: The device must be present on the power line (plugged in) in order for the password to be confirmed and added to the network. If the device could not be located, a warning message will be shown.

The **Scan** button is used to perform an immediate search of the Powerline devices connected to the Powerline network. By default, the utility automatically scans every few seconds and updates the display screen.

A typical screen after naming and supplying passwords might appear as in Figure 3-5.

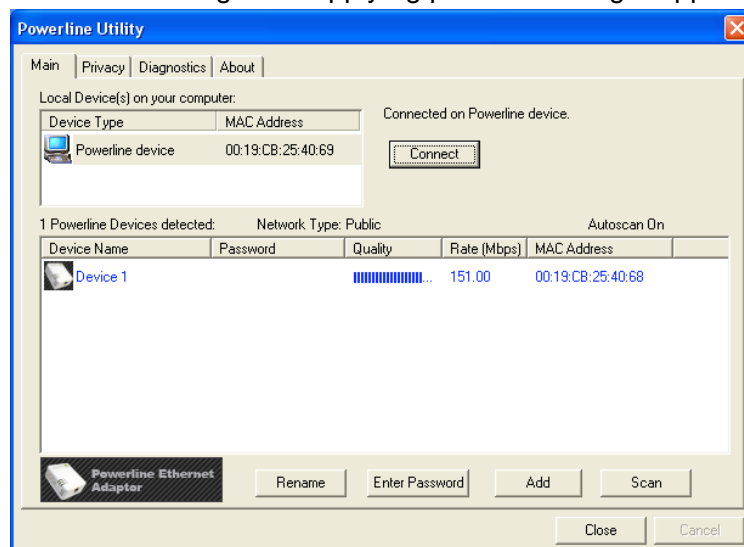

Figure 3-5: Main Screen of the Configuration Utility

3.2 Privacy Screen

The Privacy screen provides the user with an option to maintain security for their logical network and also to select the devices that has to be included in the network. The appearance is shown in Figure 3-6. All powerline devices are shipped using a default logical network (network name), which is normally “**HomePlug**”. The Privacy dialog screen allows user to change to a private network by changing the network name (network password) of devices. The user can always reset to the HomePlug network (Public) by entering “**HomePlug**” as the network name or by clicking on the “**Use Default**” button. “**HomePlug**” as the network name or by clicking on the “**Use Default**” button.

Note: Changing the network name to anything other than HomePlug will show the network type on the main screen as Private.

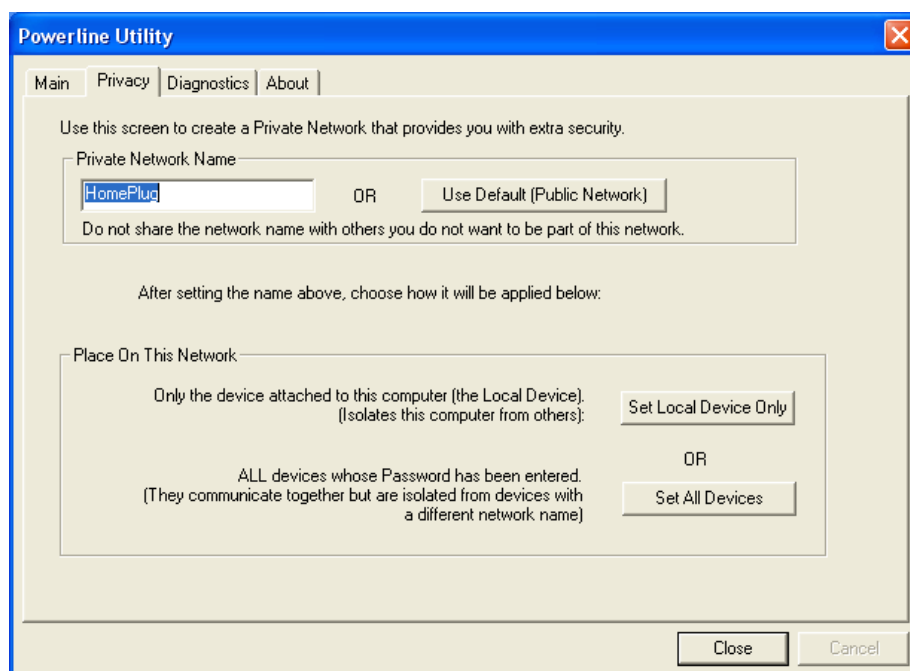

Figure 3-6: Privacy Screen

The **Set Local Device Only** button can be used to change the network name (network password) of the local device. If a new network password is entered, all the devices seen on the Main panel prior to this will be no longer present in the new network, effectively making the local devices not to communicate to the devices who were in the old logical network. Devices previously set up with the same logical network (same network name) will appear in the device list afterward selecting this option.

The **Set All Devices** button is used to change the logical network of all devices that appear on the Main panel whose Device's Password had been entered for the same logical network. A dialog window will appear to report the success of this operation. For devices whose device password's were not entered, this operation will fail and will report a failure message.

3.3 Diagnostics Screen

The **Diagnostics** screen shows System information and a history of all remote devices seen over a period of time. The appearance is shown in Figure 3-7.

The **Upper panel** shows technical data concerning software and hardware present on the host computer which were used to communicate over HomePlug on the Powerline network. It shall include the following:

- Operating System Platform/Version
- Host Network Name
- User Name
- MAC Address of all NICs (Network interface card) connected to the host
- Identify versions of all Driver DLLs and Libraries used (NDIS) and optionally
- HomePlug chipset manufacturer name
- MAC Firmware Version
- MAC addresses of all devices connected locally to the host
- Version of the Configuration Utility
- Vendor name

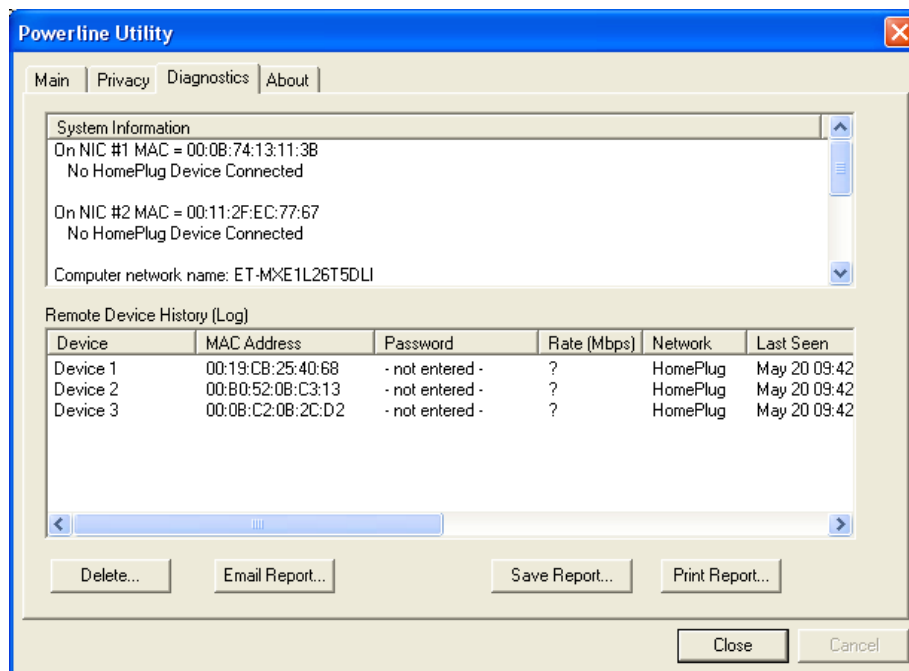

Figure 3-7: Diagnostics Screen

The **Lower panel** contains a history of all remote devices seen on the computer over a certain period of time. All devices that were on the powerline network are listed here along with a few other parameters. Devices that are active on the current logical network will show a transfer rate in the Rate column; devices on other networks, or devices that may no longer exist are shown with a “?” in the Rate column. The following remote device information is available from the diagnostics screen:

- Device Alias Name
- Device MAC Address
- Device Password
- Device Last known rate
- Device Last Known Network name
- HomePlug chipset manufacturer name
- Date device last seen on the network
- MAC Firmware Version.

The diagnostics information displayed may be saved to a text file for later use, or can be printed for reference for a technical support call. Devices, which are not part of the network anymore, can be deleted using the delete button. A dialog window pops up with a confirmation message if we try to delete a device whose password has been entered.

3.4 About Screen

The **About** screen shows the software version.

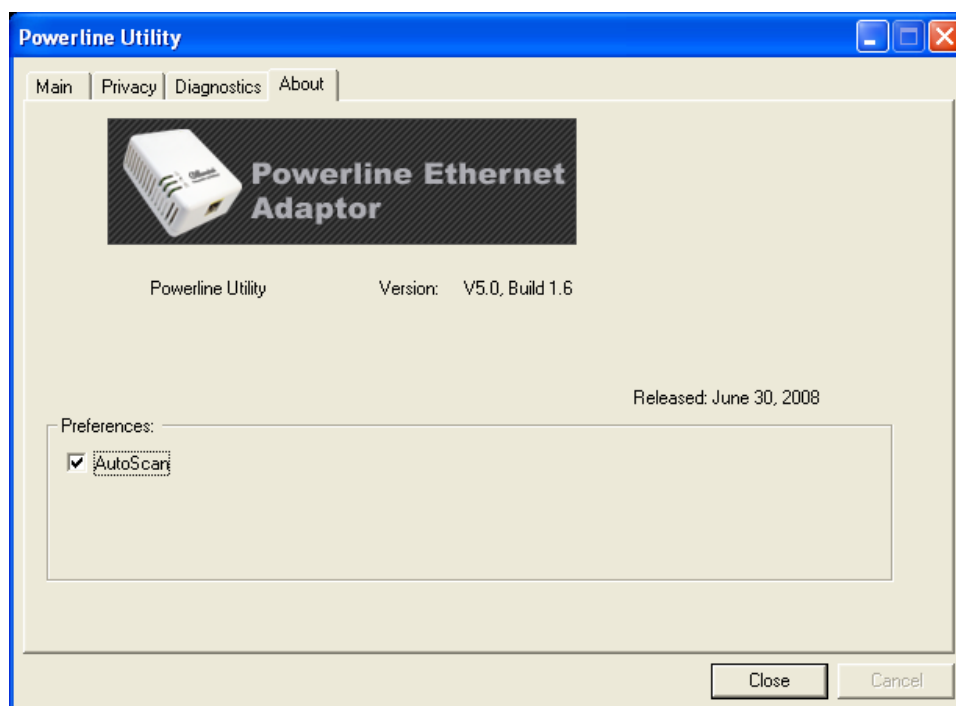

Figure 3-8: About dialog screen

4 – Reset and Network ID Buttons Setting

There are 2 buttons on the device, one is Reset button the other is Network ID button.

4.1 Reset Button

Reset: Push this button can reset to the factory default settings. **Be careful, when you press the reset button, please remove the Ethernet cable (RJ-45 cable) first, and then press the reset button. After press the reset button for less than 3 seconds and then wait the PWR LED light again. Don't power off when the device is in reset process.**

4.2 Network ID Button

Network ID : auto secure and group the Powerline devices, the follow is the scenario for secure button.

Network ID Button trigger state conditions

“Adder state” for a device providing the NMK for an existing AVLN

“Joiner state” for a device that will join an AVLN

Pushing buttons on any two devices results in one of them becoming an “adder” and the other one a “joiner”

5 – Four possible scenarios

5.1 Case 1: Forming a Network

Two devices with different network membership key (NMK) values are connected to the same powerline. The user wants them to form a logical network.

1. Press each device Network ID button > 10 sec till all LEDs re-flash to generate the random network password key first.
2. Press the button on the first device for less than 3 seconds.
3. Press the button on the second device for less than 3 seconds. The button on the second device must be pressed within 1 minute, by default however the interval is programmable.
4. Wait for connection to complete.

The PWR LED on both devices will flash evenly at 1-second intervals until the operation succeeds or fails. It will illuminate steadily on successful completion. If an error occurs, the PWR LED on the “adder” will flash unevenly until the Network ID button on the “adder” is pressed again or the “joiner” is reset by holding the Network ID buttons down for more than 10 seconds.

The join operation can be cancelled by pressing the Network ID button on the first device again, for less than 3 seconds, instead of pressing the button on the second device.

5.2 Case 2: Joining a Network

In this scenario a network exists. The user wants a new device, the “joiner”, to join the network. Any device on the existing network can become the “adder”.

1. Press the Network ID button on the “joiner” for less than 3 seconds.
2. Press the Network ID button on any network device for less than 3 seconds, making it the “adder”. You have 1 minute, by default, to press this Network ID button.
3. Wait for connection to complete.

The PWR LED on both devices will flash at 1-second intervals until the process succeeds or fails. It will illuminate steadily on success. If an error occurs, the PWR LED on the “adder” will flash unevenly until the Network ID button on the “adder” is pressed again or the “joiner” is reset by pressing the Network ID button for more than 10 seconds, as described in Case 3:

The join operation can be cancelled by pressing the Network ID button on the first device again, for less than 3 seconds, instead of pressing the Network ID button on the second device.

If you press Network ID buttons on three or more devices, only the first two will respond. The others will not. See Case 4 for a variation on this rule.

You can press the Network ID button on the “adder” before pressing the Network ID button on the “joiner”. It does not matter which is pressed first. See Case 4 for a case where the “adder” may be pressed before the “joiner”. Once a “joiner” becomes a member of the network, it may become the “adder” in the next join operation.

5.3 Case 3: Leaving a Network

A network exists. The user wants to remove one device, the “leaver”, from that network, for whatever reason. He may want to remove the device from service altogether or have it join another logical network.

1. Press the Network ID button on the “leaver” for at least 10 seconds. The device will reset and restart with a random NMK.
2. Wait for reset to complete.

The PWR LED on the “leaver” will momentarily extinguish during reset, flash during restart then illuminate steadily. No errors can occur.

Once the process completes, the user may disconnect the device from the medium or join it to another logical network on the same medium, as described in either Case 1 or Case 3.

5.4 Case 4: Join Multiple Devices to a Network

To add several new devices to an existing network, the process in Case 2 must be repeated for each “joiner”. A vendor may implement a mode of operation in which an “adders” device in the network remains in the adders state for an extended period allowing additional “joiners” to be added in turn. This lets you press the “adders” Network ID button once then press each “joiner” Network ID button in turn.

If Network ID buttons are pressed on two or more joiners, only the first one will respond. The second will not. This makes timing important.
